

# Teacher guide: Drug concentration

http://www.fisme.science.uu.nl/toepassingen/22038

This activity is designed for 16 year old students (grade 10) as introduction to difference equations in mathematics. It is an activity for two lessons.

### A sample lesson plan

### Lesson 1

10 minutes: create groups & introduce the problem and the working plan and distribute the task

10 minutes: students work in groups on the task

10 minutes: discuss with the whole class whether all groups have an idea how to start and how to proceed. Exchange strategies and make sure that everybody has an idea what is expected.

15 minutes: students work on the task, finish calculations and prepare the building blocks for their flyer.

### Lesson 2

20 minutes: students finish their flyer

20 minutes: presentations of a few examples

10 minutes: reflection on the task (and positioning it in further work)

A doctor presents the following details about the use of a specific drug:

- An average of 25% of the drug leaves your body by secretion during a day.
- The drug is effective after a certain level is reached.
- Therefore it takes a few days before the drug that you take every day is effective.
- Do not skip a day.
- It can be unwise to compensate a day when you forgot the drug with a double dose the next day.

N.B. These details are a simplification of reality.

### **Investigation**

- Use calculations to investigate how the level of the drug changes when someone starts taking the drug in a daily dose of 1500 mg with for instance three times 500 mg.
- Are the consequences of skipping a day and/or of taking a double dose really so dramatic?
- Can each drug level be reached? Explain your answer.

### **Product**

Design a flyer for patients with answers to the above questions. Include graphs and/or tables to illustrate the progress of the drug level over several days.

The mascil project has received funding from the European Union's Seventh Framework Programme for research, technological development and demonstration under grant agreement no 320 693

# **Suggestions**

The task can be extended by asking students what happens when you vary the daily dose and/or the percentage by which the drug leaves your body. What is the effect on the resulting (converging) drug level? Such questions can also be used to differentiate within a class and to challenge high achievers.

# **Example student work**

The illustrations below show parts of solutions of students. They illustrate the kind of reasoning of the students with repeated calculations using tables and graphs. This work can be used for the introduction of difference equations. As you can also see, with similar information students reached quite different results. This is important for reflecting on the relevancy for understanding such mathematical processes in the world of work.

Solution 3 shows the work of a small group (in Dutch) that really prepared a kind of flyer. The teacher of these students highly valued the reality character in the task

The mascil project has received funding from the European Union's Seventh Framework Programme for research, technological development and demonstration under grant agreement no 320 693

## **Solution 1**

	1 <sup>t</sup> x	2 <sup>e</sup> x	3 <sup>c</sup> x	totcal
dagi	375	375	.375	1125
tag 2 - 1	(125+506) 0,75 1210,75		(1789.06150c)6,7s	1341.8
3 3 ·	(1341,0+500)0,75 1381,35			1433,26
lag 4		7267	(1462,461500)0,76 1471,84	1431,04
ag s	(147,24500)0,35 (147,24500)0,35 18240,84	(484,16	(1484,16)1500)075 1488,18	1400,12
ag 6.	(1488,12Kcc) 075 1491,09		(1492,32.600)075 1494,99	1494,99

### **Solution 2**

The mascil project has received funding from the European Union's Seventh Framework Programme for research, technological development and demonstration under grant agreement no 320 693

### **Solution 3**

De verschiltijen worden niet constant dus is het ook niet mogelijk bij deze rij een drecte formule te geven. Wel is er een recusieve formule die luids : 11+1 = (1500 + 111) \* 0,7

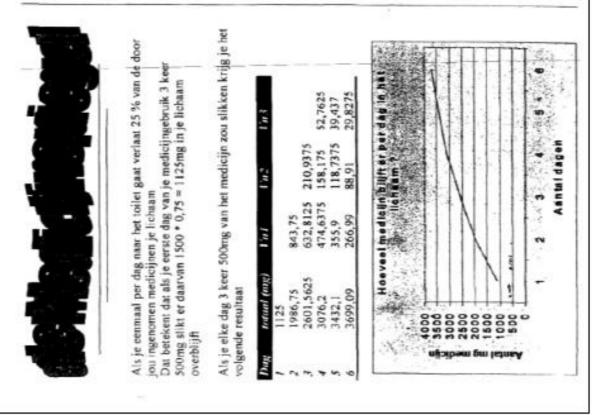

Dit betekent dat het aantal medicijn in je lichaarn geleik is aan het aantal van de vorige dag, daarbij komt 1500 mg en na het plassen blijft er nog 75 % van de totale hoeveelheid over in je lichaam Het kan gebeuren dat je een dag vergeet je medicijnen in te nemen Kun je dan zomaar de volgende dag de dubele dosis innemen en heeft dit gevolgen voor het eindpeil

Dat is in een tabel duidelijk weer te geven

I keer overvlan	1125	843,75	2882,8125
Constant	1125	1986,75	2601,5625
Day	1	**	F

wordt het verschil steeds groter en krijgt het weldegelijk invloed op het eindpeil. Het is dan ook niet aan te raden dit te doen want Maar als je meerdere dagen overslant en het later compenseert Tussen de eindhoeveelheden zit niet zo een groot verschil. hierdoor krijg je een veel te hoog eindpeil ongeveer 281,25 mg

dan gewenst als je elke dag constant de medicijnen neemt. Dit kan Het kan natuurlijk ook voorkomen dat je een ander eindpeil hebt komen doordat je gemiddeld meer of minder dan 25% uitscheld Maar ook door hoe snel het lichaam de stoffen opneem e d
